This readme file explains the logic and functions for each file of codes.

Interface source code

popup.html
Structure pop-up page of the extension to display the information panel that websites collect and the user setting panel.

options.html
Structure the page where users can modify their privacy preferences to display the provided choices.

Functions source code

popup.js
This file includes functions and operations behind the interface defined by 'popup.html'. The function 'website_setting' detects whether the current website is in our lists and takes respective operations.
The function 'user_setting' obtains users' preferences saved in 'options.html' and displays them in the icon form.

background.js
This file works as a transfer station. It receives the URL submission from 'popup.html' and sends it to the back end.

options.js
This file mainly supports functions and operations behind the interface 'option.html', which provides preference selection and save actions.

jquery-2.2.js
This file is a dependent JavaScipt file of our html files to perform DOM operations.

Configuration file

manifest.json
This file specify basic parameters that our extension needs.
